Who uses Keeper? Thousands of organizations trust Keeper including Chase, Credit Union of Ohio, Raymond James, Quest Federal Credit Union and more.

Data Breaches ‘Breaking the Bank’ for Financial Institutions
Banks, credit unions and other financial institutions are prime targets for cybercriminals and the industry has been pummeled in recent years by wave after wave of cyberattacks. A recent report from Deloitte notes that cybersecurity continues to be a risk, and that cyberattacks from state actors are a growing threat to the industry. For credit unions, small staff and lean budgets lead to increased risk.

Help Meeting Financial Services Compliance
Financial services reporting requires access tracking, least-privilege controls and audit logs. Keeper enables role-based controls and visibility into shared credentials. Access logs to Keeper vaults can be audited for compliance or forensics, making reporting much easier for IT managers at financial institutions.

Microsoft Active Directory Synchronization
Keeper® AD Bridge synchronizes to Microsoft Active Directory or Open LDAP. This enables rapid user provisioning and automatically adds Nodes (organizational units), Users, Roles and Teams. Keeper enables role-based access control and the ability to track roles as people move throughout the organization. This includes automatically locking vaults of employees that leave.

Reduce Support Costs
Drastically reduce help desk costs related to password issues. Forrester found that several large companies have allocated over $1 million annually for password-related support.

Increase Productivity
Save employees time, frustration and eliminate the need for them to reuse and remember passwords. Keeper will generate strong, random passwords and automatically fill them for users. The Keeper vault, with a responsive and intuitive UI, is available to employees from any device and location. Everything Keeper does is geared towards quick user adoption and security. Keeper is published in 21 languages for global use.

Automate Back-End Password Rotation
Keeper® Commander SDK provides IT admins and developers with command-line tools and Python source code to perform password management, password rotation and vault functionality. Eliminate hard-coded or plaintext back-end passwords. Connectors include Unix, Windows and AD logins; Oracle, Microsoft SQL, MySQL, Postgres and Dynamo databases; and AWS password and API access keys.

Key Features
- Enhanced protection with two-factor authentication (2FA)
- Secure file storage and sharing
- Cloud-based, OS and device independent
- Admin console with reporting, auditing and analytics
- Fast deployment with AD/LDAP provisioning
- 24x7 support

Key Benefits
- Maintain regulatory compliance
- Increase employee productivity
- Enforce password policies and procedures
- Reduce help desk costs
- Minimal training, fast time-to-security
- Improve employee security awareness and behavior
Two-Factor Authentication
Keeper supports Two-Factor Authentication (2FA) including SMS, Keeper DNA® (smartwatch tap), TOTP (e.g. Google Authenticator and Authy), FIDO U2F (e.g. Yubikey), Duo and RSA SecurID. 2FA may be enforced through role-based controls.

Zero-Knowledge Architecture
All encryption and decryption is done on the user’s device. PBKDF2 with 100,000 rounds is used for deriving a key from the user’s master password. Each record is encrypted using AES-256 with a different and unique key that is randomly generated client-side. RSA encryption is used for secure record sharing between users and teams. Keeper’s infrastructure syncs encrypted ciphertext between devices. All data in transit and at rest is always encrypted - it cannot be viewed by Keeper Security employees or any outside party.

Email Auto-Provisioning
Large organizations such as universities can provision Keeper vaults to thousands of users with a domain match on email addresses. With minimum administration, large-scale deployment can be accomplished using an existing email channel or portal.

For Financial Institutions, Support for Departments, Offices and Branches
Keeper was created to support nodes and organizational units to accommodate any-sized institution. The Keeper Administrator can structure password management policies by role, team and organizational unit. Thus, different divisions, branches, and office locations can all be protected with Keeper, while having different access rights, permissions and policies for enforcing secure password management across the institution. Each business unit may utilize multiple Keeper Administrators with fine-grained permissions over their users, roles and teams.

Keeper Integrates with Leading SSO Solutions
Keeper® SSO Connect integrates into your IdP and is the perfect solution for applications that don’t support SAML protocols. Keeper also provides users with privileged access, a secure vault to store all of their non-SSO passwords, digital certificates, encryption keys and API access keys.
